

Problem Set 4, Problem 0

Put your response to the reading below.

IMPORTANT: *Your entire response should fit on this page.*

His vision is definitely a hopeful one. I can see why people would be afraid of his predictions since they kind of imply becoming something else that may no longer be considered human, but I personally do look forward to his predictions becoming true. It would basically be a transcendental step in human evolution that would broaden the scope for human knowledge and power to unimaginable limits. If we were to interact with machines in the way that he describes it, it would be like fusing with them. We could get rid of our biological and physiological limitations and truly be more than a super human, for I doubt that that type of species could still be called human. This concept has been explored in lots of science fiction stories, and the fact that technology has reached a point where these things can no longer be called science fiction is truly exciting.
