

Problem Set 8, Problem 0

Put your response to the reading below.

**IMPORTANT:** When you are done, you must download the file as **plain-text**, *not* as a PDF. Use *File->Download->Plain Text*.

Usually, machines learn and operate differently than humans do. As a matter of fact, they usually execute functions and programs but never actually gain any knowledge from it. However, what machine learning seems to be doing is making a program that self-improves itself with every action that it executes. However, although this is more in line with how humans learn, it is still not exactly the same since these types of AI are more narrow and can only focus on one specific task rather than linking it with other topics or operations that it could have done. In addition, I also believe that these machines will eventually stop needing human help to correct whatever blunders they've made since they'll be making less and less mistakes as time goes on. Of course, they'll still need a human to guide them and tell them what their end goal should be, but that's more controlling the machine rather than assisting it.
